Project Information (EN)

Perverted Norm, Normal Pervert

Dr. Joris M. Koene's research demonstrates the "gender fluidity" of another species, which is the starting point of this project at some level. Scientist Joris's expertise lies in the hermaphroditic reproduction strategies of snails, and he has a well-equipped breeding system for freshwater snails. Through the system, Joris M. Koene's research has revealed various aspects of snail reproduction. From his research, we find that part of the nature in snail's sexual activities, which are taken for granted, may seem abnormal in human society. However, the abnormal sexual activities in snail's world become normal in the context of human society. That is to say, in this case, the definition and boundary of "normality" and "pervert" are fluctuating and unstable. Such "fluidity" reflects the affinities and differences among different species; in the meantime, such fluidity prompts us to rethink about the rigidity of human society's perception of sex. In this project, Ku first focuses on four particularities of "sex" to compare and contrast the sexual activities between snails and humans, taking the scientist's research as the basis, for the following visual art creations.
