

Forearm Crutch Holder

A design that uses the help from a ready available product to hold your crutches!

Hosted by: Manasvi Kale

Project Information (EN)

What is the issue?

As children from ages 10-14 year olds tend to be more clumsy and are not aware of their surroundings, the placement of the crutches may not be safe in terms of harming other individuals (tripping on the crutches). Being involved in such a situation for someone with a severe leg injury could aggravate their condition even further, proving to be even more harmful.

What is the product?

Easily slot in your crutches into the product and clip the bulldog clip (the ready available product) onto a chair, table, etc. This product reduces the risk of harming the individual with a leg injury as well as others. This product also finds an alternative solution of placing the forearm crutches.

Projectinformatie (NL)

Wat is het probleem?

Aangezien kinderen in de leeftijd van 10-14 jaar onhandiger zijn en zich niet bewust zijn van hun omgeving, is het plaatsen van de krukken mogelijk niet veilig in termen van schade aan andere personen (struikelen op de krukken). Betrokken zijn bij een dergelijke situatie voor iemand met een ernstig beenletsel kan hun toestand nog verder verergeren en zelfs nog schadelijker blijken te zijn.
